X Drama Open Source Whitepaper

Version: 1.0
Date: April 28, 2026
Open Source Repository: https://github.com/XDrama-Platform/Whitepaper

---

1. Executive Summary

X Drama is a global, open-source Web3 short drama distribution platform, pioneering the "Watch-to-Earn" model. Built on blockchain technology, we aim to redefine the global entertainment industry by allowing users to watch high-quality short dramas for FREE while earning tangible token rewards.

We are launching first in India, targeting its 650 million smartphone users, followed by a global expansion into Southeast Asia, Japan, Korea, and Mainland China.

Our core innovation is a deflationary token economic system that turns user attention and engagement into valuable digital assets, creating a sustainable, win-win ecosystem for users, creators, and partners.

---

2. Introduction

2.1 What is X Drama?

X Drama is not just another video app. It is a decentralized entertainment ecosystem that integrates:

- Free Video Streaming: Access to thousands of hit short dramas without any subscription fees.
- Social & Community Interaction: Built-in social features to share and discuss dramas.
- Task-based Reward System: Users earn rewards by watching, sharing, and interacting with content.
- Web3 Token Economy: A transparent, on-chain economic system that ensures fair value distribution.

2.2 Our Vision

To democratize entertainment. We believe that everyone should have access to premium content for free, and that their time and attention should be valued and rewarded. By leveraging Web3 technology, we are building a platform where the users own the platform.

---

3. Market Opportunity

3.1 The Indian Market

- Massive User Base: India has over 650 million smartphone users, with a rapidly growing appetite for short-form video content.
- Low Penetration of Paid Content: Most users are price-sensitive and cannot afford traditional OTT subscriptions.
- High Engagement: Short dramas are extremely popular, with high daily usage time.

3.2 Pain Points of Traditional Platforms

- High Cost: Users have to pay per episode or subscribe to watch content.
- Intrusive Ads: Free platforms are filled with disruptive advertisements.
- No Value Return: Users spend hours watching content, but get nothing in return except entertainment.
- Centralized Control: Platforms capture all the profits, while users and creators get a small share.

---

4. Core Features

4.1 100% Free Content

- Unlimited Access: Thousands of short dramas are available for free. No pay-per-view, no subscription walls.
- Ad-Free Experience: Premium members can enjoy a completely ad-free viewing experience.

4.2 Watch-to-Earn Mechanism

This is the core of our platform. Users can earn X Drama Tickets by:

- Watching short dramas (just 1 minute per day to qualify)
- Daily check-ins
- Liking, commenting, and sharing content
- Browsing advertisements

- Inviting friends to join the platform

4.3 XDT Token Economy

The XDT Token is the native currency of the X Drama ecosystem. It is built on blockchain to ensure transparency, security, and ownership.

Key Properties of XDT:

- Minted from Tickets: Users can convert their earned X Drama Tickets into XDT Tokens.
- Deflationary Design: The entire ecosystem is built around a strict deflationary model to ensure long-term value.
- On-chain Transparency: All transactions are recorded on the blockchain, publicly verifiable.
- Transferable & Tradable: XDT can be transferred between users and traded on supported exchanges.

---

5. Economic Model & Tokenomics

5.1 Tokenomics Overview

We have designed an 8-layer deflationary mechanism to ensure the long-term scarcity and value of XDT.

5.1.1 Token Supply

- Total Maximum Supply: 1,000,000,000 (1 Billion) XDT.
- Ultimate Circulating Supply: After all deflationary mechanisms, the final circulating supply will converge to 100,000,000 (100 Million) XDT.
- No More Issuance: Once the 1 Billion supply is fully minted, the minting function will be permanently shut down. No more tokens will ever be created.

5.1.2 The 8-Layer Deflationary Mechanism

1. Hard Cap Model: Fixed total supply cap with no possibility of inflation.
2. Base Fee Burn: Transaction fees are automatically burned (EIP-1559 style).
3. Reward Decay: The daily reward output decreases over time.
4. Halving Model: The minting rate halves periodically to reduce supply.
5. Platform Buyback & Burn: Platform profits are used to buy back XDT from the market and burn it permanently.
6. Dynamic Supply Tightening: As the network grows, the supply growth slows down.

7. Idle Ticket Burn: Unused, idle tickets are burned at 5% per month.
8. Profit Buyback: A portion of platform profits is dedicated to regular buyback and burn events.

5.1.3 The Cycle

1. User Engagement: User watches dramas, interacts, earns Tickets.
2. Minting: User mints Tickets into XDT, Tickets are permanently burned.
3. Scarcity: As more tickets are burned, XDT becomes scarcer.
4. Value Appreciation: Scarcity drives value, increasing the earning power of users.
5. Growth: Higher rewards attract more users, creating a positive flywheel effect.

---

6. Service Agent Network

To achieve rapid global expansion, we have built a robust Service Agent network.

6.1 Why Agents?

- Localized Growth: Agents help us penetrate local markets, understand local culture, and acquire users efficiently.
- Low Cost: Performance-based compensation reduces our customer acquisition cost.
- Community Building: Agents build and manage local communities, improving user retention.

6.2 Agent Tiers

1. City Level Agent: For major cities.
2. District/County Level Agent: For smaller districts.

6.3 Agent Benefits

Agents earn generous shares of the platform's revenue, including:

- A percentage of the network's transaction fees.
- A share of the platform's advertising revenue.
- A share of creator revenue and merchant advertising revenue.
- Benefits from the growth of their local community.

---

7. Technology & Open Source

7.1 Open Source Philosophy

X Drama is an open-source project. We believe in transparency and community governance.

- Open Protocol: Our core protocol is open source, allowing anyone to audit the code.
- Transparent Economics: All economic rules are coded into smart contracts, immutable and transparent.
- Community Driven: The future of the platform is governed by the community of XDT holders.

7.2 Blockchain Infrastructure

- On-chain Proof of Work: All user contributions are recorded on-chain.
- Secure Wallet: Built-in non-custodial wallet for users to manage their XDT.
- Anti-Cheat System: Advanced on-chain and off-chain systems to prevent bots and cheating, ensuring fairness.

---

8. Roadmap

Q2 2026 - India Launch

- Launch X Drama App in India.
- Initial onboarding of users and agents.
- Release of the Open Source Whitepaper.

Q3 2026 - Southeast Asia Expansion

- Expand to Indonesia, Vietnam, Thailand, and other SEA markets.
- Launch localized content for SEA users.

Q4 2026 - East Asia Expansion

- Launch in Japan and Korea.
- Integrate local payment methods and social login.

Q1 2027 - China Mainland Launch

- Launch in the Chinese market.
- Full global network operational.

2027 & Beyond

- DAO Governance: Transition to full community governance.

- Creator NFTs: Allow creators to tokenize their content.
- Cross-chain Integration: Support for multiple blockchains.

---

9. Open Source Statement

This whitepaper is open source and hosted on GitHub. We invite developers, researchers, and community members to contribute to the X Drama ecosystem.

License: MIT License.
Repository: https://github.com/XDrama-Platform/Whitepaper

By opening up our code and documentation, we aim to build the most trusted and transparent entertainment platform in the world.
